

Internship Report

Of

Lawyerguide — A Full-Stack Legal Consultation Platform (Frontend & User Experience)

Submitted To
School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of
MCA

By
Roll Number of Student: [25SCS2040004859]
Name of Student: SONAM SINGH
Batch: [2025-2027]

2026-27

CANDIDATE'S DECLARATION

I, Sonam Singh, do hereby declare that the internship report titled "Lawyerguide — A Full-Stack Legal Consultation Platform (Frontend & User Experience)" has been completed by me to fulfil the requirement for the award of the degree of MCA in Computer Science and Engineering / Computer Applications. All the references have been quoted and I have not taken as such any material from any other source. I affirm that this report is my own and has not been submitted to any other institute for any degree/diploma requirement, and further I shall be solely responsible for any kind of copyright violation in this regard.

Student Name: Sonam Singh

Roll No.: [25SCS2040004859]

ACKNOWLEDGEMENT

I am using this opportunity to express my gratitude to everyone who supported me throughout the internship program at Jivu Infosolution. I am thankful for their aspiring guidance, invaluable constructive criticism, and friendly advice during this work. I would like to sincerely thank my project mentor and the entire development team at Jivu Infosolution for giving me the opportunity to work on the "Lawyerguide" legal-consultation platform, and for their continuous support and technical guidance throughout the duration of the internship.

I would also like to thank the faculty of the School of Computer Science and Engineering, IILM University, Greater Noida, for their academic support and for providing me the platform to undertake this industrial internship as part of my curriculum.

I express my gratitude to my parents for their blessings and constant encouragement.

INTERNSHIP OFFER LETTER & EXTENSION APPROVAL

This internship is currently ongoing and has not yet concluded; consequently, the Internship Completion Certificate has not been issued by Jivu Infosolutions and could not be attached at the time of preparing this report. In lieu of the completion certificate, the offer letter and the internship extension approval (received via email) are attached below as proof of enrolment and of the approved extension.

- Offer Letter (dated 22 May 2026): Jivu Infosolutions offered Sonam Singh the position of Software Developer Intern (Department: Software Development / IT) for an initial duration of 45 days, commencing 8 June 2026, on-site at the company's Noida office, with a monthly stipend of ₹18,000 subject to attendance and performance. First page shown in Annexure A below.
- Internship Extension Approval: On the basis of a written request from Sonam Singh citing the university requirement of a minimum 90-day internship for academic fulfilment, the HR Department of Jivu Infosolutions approved extending the internship duration from the original 45 days to a total of 90 days (i.e., from 8 June 2026 through on/around 5 September 2026). See the approval email in Annexure B below.
- The Internship Completion Certificate will be obtained from Jivu Infosolutions and appended to this report upon successful conclusion of the extended internship period.

Annexure A: Offer Letter (First Page)

Subject: Offer Letter for Software Developer Internship

Dear, Sonam Singh

We are pleased to offer you the position of Software Developer Intern at Jivu Infosolutions. Your skills, enthusiasm, and interest in software development have impressed us, and we are excited to have you join our team. The details of your internship are as follows:

Internship Details

- Position: Software Developer Intern
- Department: Software Development / IT
- Internship Duration: 45 Days
- Joining Date: 08/06 / 2026
- Work Mode: On-site
- Office Timing: 10:00 am
- Reporting To: 10:00 am

Stipend & Benefits

- You will receive a monthly stipend of ₹18,000 during the internship period.
- The stipend will be credited monthly based on attendance and performance.
- Internship completion certificate will be provided after successful completion of the program.
- Practical training on live projects and real-world development environment will be provided.
- Opportunity to work on technologies such as React, ASP.NET, SQL Server, APIs, HTML, CSS, JavaScript, etc.

We Kinds Regards  Jivu Infosolutions	Receive & Accepted Sonam Singh
---	---------------------------------------

Offer Letter – Page 1 of 3 (Software Developer Intern, 45 days, joining 8 June 2026)

Annexure B: Internship Extension Approval (Email from HR Department, Jivu Infosolutions)

Extension Approval Email – 45 days extended to 90 days

4. Project Description

4.1 Introduction

This report presents the work carried out by Sonam Singh during a summer internship undertaken at Jivu Infosolution, commencing on June 8, 2026. The internship was carried out as part of the curriculum requirement for the degree of MCA/BCA at the School of Computer Science and Engineering, IILM University, Greater Noida, U.P.

The internship was originally offered for a duration of 45 days; based on a request from the intern citing the university's academic requirement of a 90-day internship, Jivu Infosolutions approved an extension of the internship duration to a total of 90 days. As of the preparation of this report, the extended internship is still in progress (expected to conclude on or around 5 September 2026), and this report accordingly documents work completed to date; the Internship Completion Certificate will be attached upon conclusion (see Section 3).

The internship was carried out on a live, industry-oriented software project titled "Lawyerguide" — a full-stack legal consultation platform designed to connect clients seeking legal assistance with verified, practising lawyers across India through instant chat, voice and video consultation, and appointment booking. The project was built using a modern web technology stack comprising React on the front end, ASP.NET Core Web API on the back end, and Microsoft SQL Server as the relational database, with real-time communication implemented using SignalR and WebRTC.

Within the two-member intern team assigned to this project, the work was divided along frontend and backend lines. This report documents the contribution of Sonam Singh, whose primary responsibility was the design and implementation of the client-facing user interface and user experience — the React-based frontend that customers, lawyers, and administrators directly interact with, including its responsive behaviour, visual consistency, and integration with the live backend API and real-time features built by the backend contributor.

Working on a production-style codebase gave first-hand exposure to the complete software development lifecycle — requirement analysis, design, implementation, testing, defect diagnosis, and iterative refinement based on live feedback — rather than an isolated academic exercise. This report documents the organization, the problem the project addresses, the objectives and scope of the work undertaken, the technologies

used, the system architecture, the detailed methodology followed, and the outcomes achieved.

4.2 Organization Profile

Jivu Infosolution is a software development organization engaged in building custom web and application solutions for clients across different industry domains. The organization follows an agile, project-based development approach, in which small teams work directly on live client requirements — from initial feature design through implementation, testing, and iterative refinement based on stakeholder feedback.

During the internship period, the organization was engaged in the development of "Lawyerguide," a legal-technology platform intended to modernize how individuals in India access legal consultation — moving away from purely offline, referral-based engagement with lawyers toward an on-demand digital platform. Interns were integrated directly into this live project team and assigned real feature ownership rather than isolated training exercises, working alongside the existing development workflow, codebase conventions, and review process already in place for the project.

4.3 Problem Statement

Access to timely, verified legal advice remains difficult for a large section of the population in India. Individuals seeking legal help typically rely on personal referrals or in-person visits to law chambers, which is slow, geographically limiting, and offers no way to verify a lawyer's credentials or track record before engaging them. There is no unified, transparent platform through which a person with an urgent or routine legal query can instantly connect with a qualified, verified lawyer, communicate securely, schedule a consultation, and track the status of that engagement — all in one place.

On the lawyer's side, independent practitioners similarly lack an efficient digital channel to reach new clients, manage incoming consultation requests, and conduct client interactions (chat, voice, and video) without relying on ad hoc tools such as personal phone numbers or generic messaging apps, which do not integrate with case records, scheduling, or billing.

The Lawyerguide project was undertaken to address this two-sided gap by building a single web platform that allows a customer to discover and book a verified lawyer, communicate through real-time chat/voice/video, and track consultation status, while

giving lawyers a structured dashboard to manage incoming client requests, bookings, and case communication.

4.4 Project Objectives

1. To design and develop a full-stack web application connecting customers seeking legal advice with verified, practising lawyers.
2. To implement secure, role-based user authentication and authorization for three distinct user types: Customer, Lawyer/Agent, and Administrator.
3. To build real-time communication features, including instant text chat, and peer-to-peer voice and video calling, between a customer and their consulting lawyer.
4. To design and implement an end-to-end appointment booking system, wherein a customer's booking request is delivered live to the lawyer, and confirmation by the lawyer automatically establishes a connected chat session between the two parties.
5. To build an administrative dashboard enabling platform oversight, including lawyer verification management and customer account management.
6. To ensure the platform's user interface is responsive and functions correctly across desktop, tablet, and mobile viewports.
7. To evaluate the security posture of the implemented system and document findings for future remediation.

4.5 Scope of the Project

The scope of the Lawyerguide platform, as developed during this internship, covers the following functional areas:

- Customer-facing features: browsing verified lawyers by practice area, viewing individual lawyer profiles, initiating live chat and voice/video calls, booking scheduled consultations, and tracking booking status.
- Lawyer-facing features: a professional workspace/dashboard for managing incoming chats and bookings, a multi-step profile onboarding wizard, case and document management sections, and consultation history.
- Administrator-facing features: a dedicated, database-authenticated admin panel for verifying lawyer registrations, managing customer accounts, and monitoring platform activity.

- Cross-cutting concerns: real-time notification delivery, responsive design across device sizes, and database schema design to support all of the above.

The following are explicitly out of scope for the current phase of the project and are identified as directions for future work: integration of a payment gateway for consultation billing, native mobile applications (the platform is web-based and responsive), and production infrastructure/deployment automation.

From the frontend/UX perspective specifically, the scope covered building and maintaining every screen a user directly interacts with — the public marketing pages, the customer dashboard and booking flow, the lawyer's professional workspace, and the visual/interactive layer of the admin panel — along with ensuring these interfaces correctly consumed the REST and real-time APIs exposed by the backend.

4.6 Technologies and Tools Used

The frontend of the Lawyerguide platform was built entirely as a React single-page application. The technologies and tools used specifically for the frontend/UX work carried out are summarised below.

Category	Technology / Tool
Frontend Library	React 18 (functional components, hooks)
Routing	React Router v6
Real-Time Client	@microsoft/signalr (JavaScript client for live chat, typing indicators, booking notifications)
Styling	Custom CSS3 — component-scoped stylesheets, CSS Grid & Flexbox, media queries for responsive breakpoints
State Management	React Context API (authentication state), component-local state via hooks
UX Feedback	react-hot-toast (live toast notifications for bookings, errors, confirmations)
Build Tooling	Create React App (CRA), npm
Testing / Verification	Manual cross-device testing (desktop, tablet, mobile viewports) via browser DevTools and live two-session testing
Version Control Workflow	Local iterative development with file-level change tracking

4.7 System Architecture

Lawyerguide follows a three-tier client-server architecture, consisting of a presentation layer, an application/API layer, and a data layer, with an additional real-time communication channel layered on top for instant messaging and calling features.

- **Presentation Layer:** A React single-page application (SPA) that renders the customer, lawyer, and admin interfaces, communicates with the backend over HTTPS REST calls, and maintains a persistent SignalR WebSocket connection for real-time updates.
- **Application / API Layer:** An ASP.NET Core Web API exposing RESTful endpoints for all business operations (authentication, bookings, chat messages, lawyer profiles, admin actions), and a SignalR Hub that relays real-time events — new chat messages, typing indicators, incoming call signaling, and live booking notifications — between connected clients.
- **Data Layer:** A Microsoft SQL Server relational database storing all persistent application state — users, lawyer profiles, bookings, chat sessions and messages, and administrative records — accessed through Entity Framework Core.
- **Real-Time Communication:** Text chat and notifications are delivered over SignalR; voice and video calls are established peer-to-peer using WebRTC, with SignalR used only to exchange the connection-setup (signaling) messages, so that live audio/video never passes through the application server.

From the frontend's point of view, the React application is the sole consumer of both communication channels described above: it issues REST calls to the ASP.NET Core API for standard data operations (fetching lawyer lists, submitting a booking, updating a profile) and maintains a live SignalR connection for anything that must update instantly without a page refresh — new chat messages, a lawyer being notified of a new booking the moment it is created, a customer being notified the instant their booking is confirmed, and the typing indicator shown while the other party is composing a message.

4.8 Methodology

The following is a chronological summary of the major frontend and UX work carried out during the internship, from the initial platform rebrand through to the final responsive-design and usability refinements:

1. Implemented the platform's rebranding across the entire application — replacing placeholder branding with the final company identity, integrating the new circular logo component, and restructuring the primary navigation bar (reordering links, adding a dedicated "Contact Us" entry, and disabling an incomplete language option to avoid presenting a non-functional feature to users).
2. Diagnosed and fixed a recurring visual rendering defect (a white line artifact) appearing across several modal dialogs, tracing the root cause to a conflict between a CSS backdrop-blur filter and a scroll-overflow property applied to the same element, and corrected it consistently across all affected components.
3. Rebuilt the homepage client-testimonials component after identifying that every testimonial card was incorrectly displaying an identical stock photograph regardless of the reviewer's name; replaced the photo-based avatars with a generated initials-and-colour avatar system, which also removed an inappropriate dependency on unrelated stock photography of real people.
4. Redesigned the Practice Areas listing page: replaced a placeholder/random lawyer-count display with a live count sourced from the backend, corrected the per-category icon and colour mapping (which had silently fallen back to a single generic icon for every category), and fixed the associated "Find a Lawyer" call-to-action, which previously failed to return any matching lawyers due to a filtering-logic mismatch between the marketing category names and the lawyers' stored specialization data.
5. Designed and built the customer-facing appointment booking interface end-to-end, including a form for date, time, target lawyer, and consultation reason, wired to the live booking API; added a streamlined variant of this flow that is triggered directly from an individual lawyer's profile page, pre-selecting that lawyer and removing the redundant lawyer-selection dropdown for a more direct user path.
6. Designed and implemented a custom calendar date-picker component from scratch, replacing the browser's native date input (which was found to allow selection of dates that had already passed, due to a timezone-handling defect). The custom component

enforces that past calendar dates cannot be selected, mirroring the date-selection convention used by large-scale Indian booking platforms, and is styled to match the application's own visual theme rather than the browser's default appearance.

7. Implemented real-time UI features in the chat interface: a live "typing..." indicator that appears when the other participant is composing a message, and a consultation duration timer that is synchronized to the session's actual start time so both participants always see the same elapsed duration, correcting an earlier defect where each participant's timer counted independently from when they personally opened the page.

8. Built the multi-step (5-stage) lawyer registration/onboarding wizard interface — covering basic information, business details, professional credentials, bank details, and document upload — including step-progress indicators and per-step client-side validation.

9. Carried out responsive-design verification and correction across the application for mobile and tablet viewport sizes, adjusting layout breakpoints and component styling so that key flows (navigation, booking, chat) remain usable on smaller screens.

10. Participated in a codebase-wide audit to identify and remove unused/dead frontend components and duplicated utility code, improving the overall maintainability of the frontend codebase ahead of production readiness.

4.9 Expected Outcomes

By the conclusion of the internship, the Lawyerguide platform reached a functional state in which a customer can register, discover a lawyer, book or start a live consultation, and communicate in real time, while a lawyer can manage incoming bookings and client communication, and an administrator can oversee the platform through a dedicated, securely authenticated panel.

From a frontend and user-experience standpoint, the platform's interface was brought to a state where every core customer and lawyer journey — discovery, booking, live chat/call, and registration — is fully functional, visually consistent, responsive across common device sizes, and free of the specific defects identified and corrected during the internship (the testimonial photo bug, the modal rendering artifact, the past-date booking bug, and the non-functional lawyer-search flow).

Beyond the platform itself, the internship provided substantial hands-on learning in professional software engineering practice — including working within an existing codebase and its conventions, diagnosing and fixing defects using live testing rather than assumptions, coordinating frontend and backend contracts with a teammate, and understanding the practical trade-offs between feature delivery timelines and code quality/security considerations in a real project setting.

4.10 Certificates of Completion and Other Communication Mail Proof

The internship, originally offered for 45 days, has been extended by Jivu Infosolutions to a total duration of 90 days and is currently ongoing. As the internship has not yet concluded, the completion certificate has not been issued; the offer letter and the extension-approval email are attached instead in Section 3 (Internship Offer Letter & Extension Approval) of this report, and the completion certificate will be added once the extended internship period concludes.
